sql server express 2008 r2 database size: 655 download sql server database size 655 sql server database size: 655 A: What you have here is a SQL Server Express (x64) system with a database that is much older (611, according to this page) than the version of SQL Server installed. You can't just install a newer version of SQL Server over the top of a 611 database. You need to uninstall the existing SQL Server instance, install the new version, and then re-attach the database. To uninstall SQL Server Express, type `mstexec /x "c:\Program Files (x86)\Microsoft SQL Server\100\Setup Bootstrap\Release\SqlExpress\SetupBootstrap\Uninstall.msi /quiet /norestart"`. Once it's removed, you can then go to the SQL Server Installation Center and install SQL Server 2008 R2 Express (x64). You can also do this from the command line using `sqlsetup /install` which works even if you don't have administrative rights. After you've installed, you can use the SQL Server Management Studio Express or any other tool that supports Express Edition to re-attach the database. Q: Error when trying to read a record from a text file in Python 3 I'm trying to read a record from a text file using Python 3.8, and I'm getting the following error: Traceback (most recent call last): File "C:/Users/LORAN/PycharmProjects/coding/to_file_4.py", line 10, in print(lines[0]) IndexError: list index out of range I have tried to rewrite the code several times but without success. Here it is: `file = open('E:\python\data.txt', 'r') lines = file.readlines() print(lines[0])` A: You're trying to access the first element of a list which is actually out of bounds. Try something like this: `lines = []` with `open('E:\python\data.txt', 'r')` as `f: lines = [line.rstrip() for line in f]` `print(lines[0])` Also, use `open` for writing as well as reading the file. 1.
