Receiving an engineering degree and entering the design profession was the life's dream of Paul R. Martin, software developer at Autodesk. "My father was a civil engineer, and a native of the New York City area, who in his youth attended the Pennsylvania Academy of the Fine Arts in Philadelphia," Paul Martin recalled. "My mother was a classical pianist who, while not being a trained engineer, was an intuitively creative person with the artistic ability to see possibilities beyond the design parameters of what was then possible with computer technology. These two figures combined to nurture me and provide a positive example of how life can be when one's imagination is allowed to run free. They instilled in me a desire to pursue a career that enabled me to live out my life in the most creative, rewarding and productive manner." Paul Martin graduated from the University of Illinois, Urbana, with a degree in mechanical engineering. After graduation, Paul Martin began working as a systems engineer for a software company, where he assisted the engineering department in translating data from applications such as MS Word and MS Excel into an architecture language that could be analyzed and "visualized" by other people. At the same time, Paul Martin worked on "personal projects" in his spare time. "At that time, there was no connection between CAD and digital photography. The first use of the term 'CAD' was to describe work done by IBM on a CAD application for producing detailed computer-aided models of products and assemblies," Paul Martin explained. "This got me thinking about what it would be like to have a computer on the desktop that would take digital photographs and automatically produce a very detailed, accurate model. So I thought, 'what if we developed a CAD system that could do that?' It started out as a personal interest, but the more I thought about it, the more I saw the potential to do a lot of other things. At that time, there was a great deal of interest in CAD in the aerospace industry, as it was becoming clear that there would be a huge demand for lightweight, mobile aircraft. Thus, I recognized a business opportunity for AutoCAD." In 1976, Autodesk was founded by Paul Martin. After several years at the software company, Paul Martin left to become an independent software developer and producer. In 1981, Autodesk released the first version of AutoCAD, a desktop application, as a "turnkey" (integrated) CAD package. With this groundbreaking software,

History In the 1950s, the well-known cartoonist Al Capp wrote a computer program to animate The Little King, a line of paperback children's books published by Capp's company, Eastern Color Palettes, based on the classic fairy tales of the Brothers Grimm. The program was simple, and used a PDP-1 computer running the operating system CP-40 (consisting of two vacuum tubes, a keyboard and some components soldered together into a box). Later versions were also made for the PDP-6, PDP-7, PDP-8, PDP-9, PDP-15, PDP-16 and PDP-8/50. The software was written in machine language, but was a hybrid of machine language and assembler. Several thousand copies were published, and in 1976 Eastern Color The Little King became the first computer-animated book to win a copyright infringement lawsuit, brought by Thomas Y. Crowell Company against Eastern Color, on the grounds that their use of the title constituted trademark infringement, a position upheld by the U.S. Supreme Court. Later versions had more features and were more sophisticated. The computer version was written by a friend of the author, a computer programmer called John Murphy, and the film was directed by a friend of Al Capp, a cartoonist, animator and film director called Frank Tashlin. Real-time rendering In 1983 Autodesk released version 1.0 of AutoCAD, the first real-time rendering application. In addition to still rendering, this version had the ability to simulate animation. In addition to the point and line tools, a wide variety of shape tools were added, including the fill tool, and loop and extrude. The line tool became available to be used in curves, arcs, and circles, as well as straight lines and rectangles. The fill tool was available in all types of fills, including gradient fills and textures. Curve fill was added, giving the user an unlimited number of control points for drawing a curve. The user can also draw a free-form polyline or polygon, and the fill color of the polyline or polygon is based on the fill color at the line or curve control points. Textures are also available. The brush tool has increased size, and a new tool called Intersection was added. The Intersection tool helps users create objects with certain constraints. The basic shapes are all available with the basic polygon. In 1988, 5b5f913d15
