Pro Injector

Pro Injector allows you to inject DLLs into running processes. With its simple layout and intuitive user interface, this tool is quick and easy to use. Once the program is started, it will detect which processes are currently running on your computer. You will then be able to check the filename and extension of each process, as well as their PID (process ID) and full path on the disk. To modify the DLLs of a process, you have to pick a process from the list, browse your PC for the target DLL, and commit the modifications with the click of a button. A confirmation message is shown at the end to let you know that the injection task is complete. If the job is unsuccessful (for example, if the DLL is not compatible with the process), you receive an error notification. Pro Injector Screenshots: DLL Injector Key Features: Vulnerability Scanning: Check the processes which are vulnerable to known DLL exploits and exploit its DLL with only a few mouse clicks. Open Source: Pro Injector is based on open source and totally free software. Its source code is available to you. You can also perform additional development on this tool to customize it. No installation: Pro Injector is a standalone software that has a user interface that's easy to use, and allows you to save and load the applications that are running on your PC at any moment. All that you need is a USB flash drive or any other storage medium. Important: Not all applications are compatible with Pro Injector. This is a limitation that is being fixed in new versions of this software. Standalone Program: Pro Injector is a standalone application that does not need to be installed and can be used from any directory on your computer. It is designed to be portable and easy to use. All that is needed is a USB flash drive or other storage medium and the knowledge to modify its files. Minimal interface: Pro Injector has a very simple layout that makes it easy to use. You can check out the name and extension of each process and PID (process ID) and full path on the disk. It also allows you to inject DLLs into the processes of any application. What's New In?

----- We want to make the process of programming in C# a bit easier. To do that we have developed a simple C# utility called C# Injector. C# Injector allows you to add code to any application in C#. The code you need to inject will be presented in the form of a string, which will be displayed in the MessageBox displayed when the process is selected. C# Injector allows you to modify any application in C# without the need to rebuild it. When you inject code in an application it will be executed as soon as you close the application. You don't have to run the application before starting to inject.

----- What's new ----- - Fixed: Crash in the C# Injector. - Fixed: The process was selecting the application twice when installing. - Fixed: The application was installed twice after the installation. - Fixed: Unable to install the application after deleting the related registry values. - Fixed: The list of running processes was empty. - Fixed: The task wizard opened after the task was finished. - Fixed: In some cases, the program could not install the application. Reviews: If you believe this software has infringed your rights, please use our complaint form.
